VITUS Cichorium

Harvesting

The VITUS Cichorium harvests chicory efficiently and **without damage**. The machine was specially designed for harvesting chicory, where the quality of the end product is important. Thus, the chicory is harvested with **complete roots.**

Two hard steel pins lift the chicory and take it to two rotors. The rubber-coated rotors remove excess soil. The chicory is then brought up through a bar belt with a shaking system. The shaking system removes the remaining earth. An employee can then check the product and place it in the provided bins. It is also possible to opt to use a container for greater capacity.

With the VITUS Cichorium, you have an **accurate harvest result**. An important requirement for a trial centre is that different varieties can be harvested separately according to location on the trial field.

With this chicory harvester, you can **harvest chicory cost-efficiently** without damage. It is a compact, light and manoeuvrable machine that has limited impact on the soil structure and also does not require high tractor power.

- Light and compact machine
- Easily adjustable
- Harvest chicory with complete root
